

WASTE FACTSHEET

RECYCLING & MRF PROCESSES

Recycling is a much better alternative to landfilling valuable resources and much of our recycling is processed right here in NSW, thanks to Leeton's recycling partner, Kurrajong Recycling. By sorting our recycling correctly, we can save resources from landfill, extend the life of our landfills and reprocess materials into new products, using just a fraction of the resources needed to create them from scratch. You can also help to 'close the loop' by purchasing products made out of recycled materials.

WHAT CAN I RECYCLE?

Only the following items should be placed in your recycling bin:

Aluminium & steel cans including empty aerosols & foil

Plastic bottles & containers from the kitchen, bathroom & laundry

Paper and cardboard

Glass bottles & jars

The following items should NOT be placed in your recycling bin:

Plastic bags/packets

Ceramics

Electrical items

Garden waste

Food

Building materials

Polystyrene (foam)

Non-recyclable metal

Oil, paint & batteries

Syringes & medical waste

Bagged recycling or garbage

Tissues, paper towel & sanitary items

Non-recyclable hard plastics

Drinking glasses & window glass

Shoes, clothes & textiles

WHAT HAPPENS TO MY RECYCLING?

Recyclables collected from your kerbside recycling bin, are transported to Kurrajong Recycling in Wagga Wagga. Here recyclables are sorted into groups based on their material type (plastics, glass, paper/cardboard, steel and aluminium) at Kurrajong Recycling's Materials Recovery Facility (MRF). This is done via a combination of manual and mechanical sorting, whereby workers hand-sort material, and machinery such as conveyor belts, powerful magnets and more, transport recyclables and assist in the sorting process. Once recyclables have been sorted at the MRF, they are ready for processing and are sent to a range of companies, both Australian and international, to be turned into new products.

WHAT IS MY RECYCLING TURNED INTO?

After recyclables have been sorted at the MRF, they are remade or repurposed in a number of ways.

Plastics: Victorian, NSW, Queensland and international companies buy plastics sorted by Kurrajong Recycling – mainly plastic numbers 1 (PET), 2 (HDPE) and 5 (PP), as these are the most saleable. The companies may process and on-sell these plastics, or make new products such as pallets, irrigation pipes, bottles, outdoor furniture, carpet fibres, fleece jackets, fence posts and compost bins.

Glass: Some of the glass received by Kurrajong Recycling is sold to a Brisbane-based company to be made into new bottles. The majority of glass is processed into crushed glass and sold to Australian Councils and businesses to be utilised in road making, pipe-layering backfill and site stabilisation around buildings or sites such as sewage treatment works.

Paper and Cardboard: Once sorted and baled, paper and cardboard is purchased by Australian and international companies to be remanufactured into new products such as cardboard boxes, fruit and egg cartons, cereal boxes, newspaper, toilet rolls and insulation. Some paper is shredded for use as small animal bedding and litter.

Aluminium: As Australia currently has no rolling mills and very few smelting factories, aluminium must be sold to international markets such as South Korea for rolling and smelting. Recycled aluminium is used to make aluminium cans, automotive engines, window and door frames, saucepans and other homewares. Aluminium can be recycled indefinitely.

Steel: After steel cans have been sorted at the MRF, they are purchased by factories that melt and mould the steel into new shapes. Like aluminium, steel can be recycled indefinitely and is turned into new steel cans, cars, construction steel, aeroplanes and train tracks. All scrap steel received by Kurrajong Recycling is sold to a local metal business.

CLOSING THE LOOP

Closed-loop recycling refers to the process of collecting, recycling and remanufacturing recyclable materials into new products. Consumers then fully 'close the loop' by purchasing items made from recycled products. Australia is in the process of exploring new ways to support the growth of local industries and 'close the loop' within our country, thereby reducing our dependency on overseas markets. Until then, the economic viability of Australia's recycling industry depends on being able to sell into both Australian and international markets.
